# Games At Mumbai (GAM \_ \_)

- Evenly Symmetric?
- w/Easy Steps?
- ► w/Easy Rules?
- Extra Spicy?

# Talk Plan

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- ACGT: Algorithmic Combinatorial Game Theory
- Describe PSPACE and QSAT
- Reductions and Complexity
- ▶ Show reduction:  $QSAT \rightarrow GEOGRAPHY$
- ► Computational Complexity of COL and NOGO.
- Broader landscape of games.

Note: interruptible!

# ACGT

- Big Question (outcome classes): Who is winning? Who is the winner?
- How hard is it to determine the winner?
- How hard is it to compute the winner?
- How long does an algorithm run to compute the winner?
- How long does the best algorithm run to compute the winner?
- How long does the *best* algorithm run to compute the winner in the worst cases?
- How does that change as the size of the game position grows?
- We want to be thinking about the last version of this question.

► Let's start off with a game! BOOLEAN FORMULA:

- Players: True vs. False
- Position:
  - List of variables with assignments: (True, False, Unassigned)
  - Formula in Conjunctive Normal Form (CNF).
- Turn: Current player picks value for the next unassigned variable: True or False. Can't move if the formula is already obviously won by other player, or if the move would cause such an assignment.

Normal Play: If you can't make a move, you lose.

Let's try playing: http: //kyleburke.info/DB/combGames/booleanFormula.html

True wins going first exactly when the QSAT problem is trueQSAT:

$$\exists x_0 : \forall x_1 : \exists x_2 : \forall x_3 : \exists x_4 : \forall x_5 :$$
$$(x_0 \lor \overline{x_1} \lor x_2) \land (\overline{x_2} \lor x_3 \lor x_4) \land (\overline{x_0} \lor x_2 \lor \overline{x_3}) \land (x_3 \lor \overline{x_4} \lor \overline{x_5})$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

► QSAT is canonical PSPACE-complete problem.

- PSPACE: the class of all (T/F) computational problems that can be solved with a polynomial-amount of read/write space.
- Note: no restriction on the amount of time.
- Every problem in PSPACE can be reduced to QSAT in polynomial-time.
- ▶  $\forall X \in \text{PSPACE} : \exists f : X \to QSAT$  where:
  - ∀x ∈ X : x is a true instance of X ⇔ f(x) is a true instance of QSAT.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- f runs efficiently
- These transformations, reductions, are important in determining what problems can be solved.

- What can we say about two problems, X and Y where there's a reduction f : X → Y?
- What happens if there's an algorithm, B, that solves problem Y in polynomial time?
- ▶ Then there's an algorithm that solves X in polynomial time:

- Polynomial + polynomial = polynomial
- By contrapositive, if there's no efficient algorithm for X, then there's no efficient algorithm for Y.
- "Hardness follows a reduction."
   "Easiness salmons a reduction."

- ► There are reductions from everything in PSPACE to QSAT.
- PSPACE-complete: QSAT is among hardest problems in PSPACE. (Best known algorithms are exponential. "Intractable".)
- ▶ BOOLEAN FORMULA is also PSPACE-complete.
- That's good for games!
- Players use approximation, randomness, and heuristics instead of certainty.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

 CGT: hardness/completeness results are positive instead of negative.

#### Geography

- ► GEOGRAPHY is another PSPACE-complete game!
- Played on a directed graph with a token on one vertex.
- Turn: move the token along an arc; can't ever return to the vertex left behind.
- Impartial Game: both players always have same options.
- Normal Play: Lose if there's no outgoing edges.

#### Let's Play!

http://kyleburke.info/DB/combGames/geography.html

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

#### Geography

- ► Why is GEOGRAPHY PSPACE-complete?
- ► There's a reduction!
  f : BOOLEAN FORMULA → GEOGRAPHY [Schaefer 78<sup>1</sup>]
- ▶ (Very common first PSPACE-reduction.)
- Two steps: variable choosing, then evaluation.
- ► Note: could have BOOLEAN FORMULA choose all variables, then evaluate.

#### GEOGRAPHY

- Reduction: need to find a working function f.
- Reductions usually constructive, so we're building GEOGRAPHY instances.
- ▶ Needs to work for any BOOLEAN FORMULA.
- ▶ *Not onto*: doesn't need to create every GEOGRAPHY position.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

#### $\operatorname{Geography}$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## $\operatorname{Geography}$

#### GEOGRAPHY

- ▶  $\forall G \in \text{BOOLEAN FORMULA}$ : True wins going first on  $G \Leftrightarrow$ First player wins on f(G)
- Computational Hardness follows a reduction
- ► BOOLEAN FORMULA is PSPACE-complete ⇒ GEOGRAPHY is PSPACE-complete.

- ▶ Now we can reduce from GEOGRAPHY.
- What about other rulesets?

## Rulesets in PSPACE

シック 単 (中本) (中本) (日)

# Col

#### Let's do another one: COL:

- Players: Blue vs. Red
- Position: Undirected graph, with Red, Blue, and unpainted vertices.
- Turn: Current player chooses an uncolored vertex and paints it their color. You're not allowed to pick a vertex adjacent to one already painted your color.
- Normal Play: If you can't make a move, you lose.
- Created in 1976 (or earlier) by Colin Vout. (Mentioned in On Numbers and Games)

Let's try playing on a grid: http://kyleburke.info/DB/combGames/col.html

# NoGo

- ► NoGo:
  - Players: Black vs. White.
  - Position: Undirected graph, with Black, White, and unpainted vertices.
  - Turn: Current player chooses an uncolored vertex and paints it their color. You're not allowed to paint a vertex that creates a connected component of either color that isn't adjacent to an empty vertex.

Normal Play: If you can't make a move, you lose.

Created in 2005 by John Moore. (Called "Anti-Atari Go".)

Let's try playing on a grid: http://kyleburke.info/DB/combGames/noGo.html

- Let's relate these with a reduction!
- ▶  $f : COL \rightarrow NOGO.$  [BH 2019<sup>2</sup>]

<sup>2&</sup>quot;PSPACE-complete two-color planar placement games", KB, R Hearn, 2019.

• Can describe this locally: vertices and edges.

Vertices:

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

# $\begin{array}{c} f \\ \hline a \\ \hline \end{array} \begin{array}{c} b \\ \hline \end{array} \begin{array}{c} \end{array} \begin{array}{c} f \\ \hline \end{array} \begin{array}{c} \end{array} \begin{array}{c} \end{array} \begin{array}{c} \end{array}$

What can we add so a and b can't both be white? What can we add so they can't both be black?

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

#### Put them together:

Example on a graph.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Many: "On the complexity of some two-person perfect-information games", T Schaefer, 1978. Hex: "Hex ist PSPACE-vollständig." S. Reisch, 1981.

Others: "Games, Puzzles, and Computation" R. Hearn, E. Demaine, 2009.

And: "PSPACE-complete two-color planar placement games.", KB, R. Hearn, 2019.

# Closing

- ▶ PSPACE-completeness (or harder) is good
- Find a reduction from PSPACE-complete ruleset to target game. (Not the other way around!)
- Fun! Building game boards.
- Different levels of reductions. Easy: play anywhere. More complicated: Play spaces in order.
- Common paper pattern: here's a new ruleset that's interesting... and here's the complexity.
- Unknown: CHOMP, SPROUTS, CLOBBER, DOMINEERING, GORGONS (Sprouts 2024<sup>3</sup> game)

Also, please be aware of FUN 2024<sup>4</sup>: June 4-8. Submission deadline: Feb 20.

#### Thank you!
